Document ID: VIB-TECH-005 Classification: INTERNAL CONFIDENTIAL Effective Date: 2024-04-01 Version: 4.1

Document Owner: Head of Core Integrations

Integration Capability Document: VI Business (India)

1) Executive Purpose and Applicability

This Integration Capability Document defines the standardized boundaries for how VI Business (India) interoperates with a Customer's pre-existing IT ecosystem—specifically concerning ITSM (e.g., ServiceNow), Cloud SIEM forwarding, and external API gateways.

Intended Audience: Integration Architects, SOC Leads, and API Developers. **Applicability:** For accurately responding to RFP sections demanding "System Interoperability," "e-Bonding," and "API Maturity."

2) Definitions and Assumptions

Definitions:

- **e-Bonding:** Bidirectional ticket integration linking VI Business's ITSM to the Customer's ITSM via REST APIs.
- **SIEM:** Security Information and Event Management platform.

Assumptions:

- **Internal Control:** Bespoke integration development (writing custom middleware to parse proprietary customer application alarms) falls outside the standard Managed Services MSA and requires a separate Professional Services SOW.

3) Detailed Core Sections

3.1 Supported Enterprise Integrations

- **ITSM / Ticketing (ServiceNow & BMC Helix):** VI Business inherently supports bi-directional RESTful API integration. System-level e-Bonding ensures Incident Creation, Status Update, and Closure State Webhooks sync synchronously between the VI NOC/SOC and the customer environment.
- **SIEM Log Forwarding:** Native log forwarding via Syslog/CEF formats to cloud-hosted SIEM targets is fully supported. However, any log forwarding mandate is strictly subject to the DPDP Act 2023, requiring the target repository to be hosted within the Republic of India.

3.2 Identity and Access Integrations (IAM)

- **Portal Authentication:** The VI Business SD-WAN orchestration portals, EMM IoT dashboards, and reporting portals support SAML 2.0 and OAuth 2.0 for Single Sign-On (SSO). Native integration with major IdPs (e.g., Microsoft Entra ID / Azure AD, Okta, Ping Identity) is standard.
- **Access Control Mapping:** Role-Based Access Control (RBAC) securely maps directly to the customer's internal AD security groups utilizing Just-In-Time (JIT) provisioning.

3.3 API Specifications and Event Patterns

- **Enterprise IoT Platform APIs:** The VI EMM platform exposes a comprehensive, OpenAPI 3.0 specification REST API.
- **API Capabilities:** Includes endpoints for bulk SIM lifecycle actions (activation/suspension), customized data pooling allocation queries, and hourly telemetry aggregation reports utilized for proprietary fleet tracking integrations.

3.4 Security and Authentication Approach for Integrations

- **API Gateway Security:** All exposed VI Business integration endpoints are secured exclusively via TLS 1.3.
- **Authentication Flow:** Strict token-based authentication is mandated. Permitted flows include OAuth 2.0 Client Credentials Grant (for server-to-server e-Bonding) or Mutual TLS (mTLS) certificate pinning for high-security banking/financial connections. Static API keys are explicitly deprecated for Tier-1 integrations.

4) Evidence and Proof-Artifact Map

Integration Target	Specification Document	Document Owner
ITSM (ServiceNow)	`SharePoint/VIB_Integration/ServiceNow_eBonding_Spec.pdf`	ITSM Automation Lead
EMM API Repository	`https://developer.vibusiness.in/openapi_v3_spec.json`	IoT Platform Manager

5) Governance and Ownership

- **Owner:** Head of Core Integrations
- **Reviewers:** Enterprise CISO, VP Delivery Operations.
- **Review Frequency:** Annually, to coincide with API version deprecation cycles.

6) Constraints, Exclusions, and Dependencies

- **Constraints:** The customer assumes absolute responsibility for configuring their side of the e-Bonding webhook receivers. Endpoint latency exceeding `5000ms` from the customer's ITSM receiver automatically suspends the VI Business Webhook retry queue.
- **Exclusions:** VI Business (India) does not write or host application-layer code required on the customer’s side to consume our OpenAPI endpoints. We solely provide the endpoint specification, sandbox access, and authentication tokens.
