Document ID: VIB-SEC-001 Classification: INTERNAL CONFIDENTIAL Effective Date: 2024-04-01 Version: 4.4

Document Owner: Enterprise CISO

Security Overview Pack: VI Business (India)

1) Executive Purpose and Applicability

The Security Overview Pack outlines exactly how VI Business (India) defends massive enterprise network perimeters. It serves as the primary technical validation artefact addressing Chief Information Security Officer (CISO) governance requirements regarding Threat Intelligence, Managed SOC throughput, and Data Residency.

Intended Audience: Security Architects, Proposal Writers, CISO Evaluation Boards. **Applicability:** For populating highly structured security questionnaires, responding to ISO compliance tables, and defending incident response matrices during RFP evaluation.

2) Definitions and Assumptions

Definitions:

- **SOC:** Security Operations Center.
- **SIEM:** Security Information and Event Management.
- **NGFW:** Next-Generation Firewall.
- **EPS:** Events Per Second.

Assumptions:

- **Internal Control:** All assertions surrounding DPDP Act alignment, telemetry routing, and <4 hour response targets are binding legal commitments and must not be altered within the RFP narrative without formal security escalation.

3) Detailed Core Sections

3.1 Managed Security Operations Center (SOC) Architecture

- **Structure:** Operates under a 24x7x365 multi-tiered capability (L1 Triage, L2 Incident Response, L3 Malware Forensics) managed from strictly access-controlled, Tier-III certified facilities in Pune, Maharashtra.
- **SLA Commitments:**
  - **P1 Threat (Exploitation/Active Breach):** Acknowledgement within `15 minutes`. Containment (network isolation) initiated within `< 4 hours`.
  - **P2 Event (Elevated Risk/DDoS Attempt):** Acknowledgement within `30 minutes`. Resolution tracking `< 8 hours`.
- **ITIL v4 Framework:** Incident, Problem, and Change Management are rigorously defined by ITIL processes ensuring transparent reporting and root cause mapping.

3.2 Endpoint Edge Protection (NGFW) Scale Limits VI Business secures "blind" branch locations by converging SD-WAN policy with Next-Generation Firewall threat engines natively integrated at every Edge CPE.

- **Capabilities:** Granular URL filtering (60+ active categorical defenses), DPI (Deep Packet Inspection), and stateful IPS (Intrusion Prevention System) engines ingesting dynamic updates pulled natively from SOC hubs.
- **Security Limits:** Throughput capacity per appliance ranges dynamically based on the SKU. Standard deployments support 200 Mbps to 1 Gbps NGFW throughput to guarantee high-volume encrypted traffic decryption limits without degrading latency profiles below <50ms failover paths.

3.3 SIEM and Threat Intelligence Log Correlation

- **Log Ingestion Volume:** Standard multitenant cloud SIEM architectures accept upward of 5000+ Events Per Second (EPS) without requiring bespoke hardware node expansion.
- **Log Retention:** Following native DPDP regulations, core network event logs and SIEM syslog traces maintain a 90-day "Hot" retention schedule, and a standard 12-month archival rotation, isolated completely within Indian jurisdiction.
- **Threat Intel:** Active commercial feed aggregation (CrowdStrike, Recorded Future) provides immediate SIEM IOC correlation matching across the domestic backbone.

3.4 DPDP Act 2023 & Indian Data Sovereignty VI Business enforces absolute regulatory supremacy concerning internal data handling routines.

- **Data Residency Law:** 100% of SIEM log data, threat intelligence aggregations, and identity token handshakes utilized to defend the managed perimeter remain natively stored in Indian Tier-III datacenters. We unequivocally prohibit unauthorized cross-border routing of telemetry analytics data without explicit consent of the Customer (Data Fiduciary), satisfying immediate DoT and DPDP Act legal thresholds.

4) Evidence and Proof-Artifact Map

Security Posture	Evidence Validation	Owner
DPDP Alignment Policy	`SharePoint/VIB_Compliance_Vault/Data_Locality.pdf`	Data Privacy Officer
SOC Infrastructure Design	`SharePoint/VIB_Security/SOC_Architecture_HLD.vsdx`	Lead SOC Architect

5) Governance and Ownership

- **Owner:** Enterprise CISO
- **Reviewers:** General Counsel, VP Core Networks.
- **Review Frequency:** Bi-Annually. Mandatory updates following any "Priority 1" post-incident review.

6) Constraints, Exclusions, and Dependencies

- **Constraint Definition:** "Containment" rigorously entails blocking the hostile traffic from laterally progressing across the managed Wide Area Network.
- **Exclusions:** VI Business (India) categorically does not assume responsibility for sanitizing malware directly off customer-owned server clusters or manipulating standalone end-user compute devices unless an explicit Endpoint Detection (EDR) commercial scope is integrated.
